ADDITIONAL INFORMATION

- **Locker columns assembling.** Columns have holes in the side walls through which the segments are connected. First of all, you need to calibrate the height of all columns. Make sure that they all are in the same height. Then you have to fasten the segments with fittings: bushing and screw. If you do not want to connect the columns, or the row has ended and you can see the holes, there are covers included in the package, which you can use to hide the holes. Cabinet connecting details is further explained in the assembly schemes. Please, note that only columns with the same height can be connected in the row.

- **Top panel assembling.** When the height of all columns is calibrated and the segments are connected the top can be assembled. First you need to put the top panel on the columns. Then fasten it with the wood screws, through the base holes in the column roof. After that top will be fixed to the columns.

- Top panels (width and depth) are slightly larger than the measurements of the possible combination of columns. For example, combinations to which a decorative roof is offered can be in these measurements: 450, 900, 1350, 1800. But the decor panels are 451, 902, 1353 and 1804. It means, that there is a 1 mm tolerance to every additional column.
